

**GEODE POSITION PAPER ON ERGEG PUBLIC CONSULTATION ON  
DRAFT REVISION OF GGP ON ELECTRICITY BALANCING MARKETS  
INTEGRATION (GGP-EBMI)**

**GEODE, European association representing the interest of electricity and gas distribution companies** welcomes ERGEG Draft revised Guidelines of Good Practice for electricity Balancing Markets Integration (GGP-EBMI) and the opportunity to comment on it.

In that respect, **GEODE fully supports the NORDENERGI Comments on this ERGEG draft paper attached.** Nordenergi, is the joint collaboration between the Nordic associations for electricity producers suppliers and distributors and their Swedish members are at the same time, members of **GEODE**.

Particularly **GEODE** agrees that balancing market integration is a key issue in the development of the internal electricity market, and that the importance of this issue will increase significantly in the future. The RES directive and investments in new renewable power generation will lead to a drastic increase in the proportion of intermitted power generation within the European Community. As a result, future demand for balancing services will be substantial.

**GEODE** believes that the role of the TSO should be restricted to acting as a market facilitator, forwarding all economic incentives from market transactions to the market participants. Investment and generation incentives must be directed to those who supply balancing power. In order to develop the internal market, this key principle should apply to cross-border balancing trade as well as national markets. Furthermore, market participants should have full access to the balancing market in order to compare the cost of imbalance, charged by the national TSO, to the balancing market price.

**GEODE** considers that transparency is fundamental to achieve an efficient competition in a liberalised market, and therefore we strongly advise that increased transparency and monitoring should be given priority.

Barcelona, 16<sup>th</sup> March 2009

## **NORDENERGI COMMENTS ON DRAFT REVISED ERGEG GUIDELINES OF GOOD PRACTICE FOR ELECTRICITY BALANCING MARKETS (GGP-EBMI)**

Nordenergi, the joint collaboration between the Nordic associations for electricity producers, suppliers and distributors welcomes the opportunity to comment on Draft Revised ERGEG Guidelines of Good Practice for Electricity Balancing Markets, which was published on January 15, 2009. We limit our comments to those guidelines which we believe should be amended in order to promote competition in the wholesale and balancing markets, as well as to secure proper investments incentives in both balancing power and cross border capacity.

Nordenergi agrees that balancing market integration is a key issue in the development of the internal electricity market, and we are certain that the importance of this issue will increase significantly in the future. The RES directive and investments in new renewable power generation will lead to a drastic increase in the proportion of intermitted power generation within the European Community. As a result, future demand for balancing services will be substantial.

Keeping system balance is a key responsibility of the TSO. Market participants are therefore through guidelines and codes obliged as far as possible to keep their own balance regarding their bids into the market. Introducing e.g. intra-day trade enables the market participants to eliminate most of their imbalances, hence reducing the TSOs need to buy additional system- and balancing reserve capacity.

However, it is very important to make a clear separation between the TSO responsibility to maintain system balance and individual market participants keeping their own balance. In the Nordel-area system balance is adjusted within the regulating market, whereas the balancing market is where the market participants can adjust their own balances. A liquid balancing market is important; especially in order to reduce the TSOs need for system- and balancing services. Also worth mentioning is the importance of the imbalance pricing settlement giving the right incentives to all parties.

Nordenergi believes that the role of the TSO should be restricted to acting as a market facilitator, forwarding all economic incentives from market transactions to the market participants. Investment and generation incentives must be

directed to those who supply balancing power. In order to develop the internal market, this key principle should apply to cross-border balancing trade as well as national markets. Furthermore, market participants should have full access to the balancing market in order to compare the cost of imbalance, charged by the national TSO, to the balancing market price.

When describing the benefits from balancing market integration, ERGEG points out that the integrated market will help the TSO to minimise balancing cost. However, Nordenergi believes that the main benefit of the integrated market will be efficient utilisation of balancing resources. Efficient utilisation of resources is a result of a “correct” price level rather than a “lower” price level.

Transparency is fundamental to achieve an efficient competition in a liberalised market, and therefore Nordenergi strongly advise that increased transparency and monitoring should be given priority.

Furthermore, Nordenergi believes that harmonised gate closure should be a top priority, regardless of balancing market integration. Harmonised gate closure is a prerequisite for integrating and coupling markets and should be considered as a key obstacle to the development of the internal electricity market.

Finally, The ERGEG proposal describes two pricing options regarding balancing service settlement. We believe that the pay-as-bid option does not provide needed long term incentives in order to invest in balancing power capacity. As the proportion of intermitted power generation in the European energy-mix will increase in the future, proper incentives for investments must be in place. Economic theory supports that only a marginal pricing option will result in efficient allocation of resources and provide optimal investment incentives. We do not consider marginal pricing to be more sensitive to market power. In contrary, we believe pay-as-bid pricing may result in reduced transparency and less liquidity.
